Subject: Enterprise Crude Pipeline Update

Enterprise put controls in place for workers along the spill pathway to combat the elevated levels of Benzene and VOCs. Approximately 68 contractors on site conducting cleanup operations. HWY 121 has been cleaned and reopened. Vac trucks continue to recover oil, approximately 3750 bbls of oil has been recovered and is being staged on site in frac tanks. A weather contingency plan is being created to contain free oil and sheen if a rainfall event occurs. An ICS 201 was created and daily ICS 209s are being generated to document daily activities. Currently, there is no impact to a waterway. A NOFI was created and will be delivered on Wednesday. The damaged line has been excavated and attempts are being made to apply a clamp to the breached area. PMHSA arrived on site and conducted an investigation of the breach. EPA and the TRRC are working in concert with Enterprise.
